Comprehensive Land Survey and Environmental Analysis Report

KRISH EcoMap Professional Services

Advanced Geospatial Intelligence and Environmental Monitoring

Date of Submission:	September 09, 2025
Report ID:	LSR-20250909-0003
Project Name:	AI Scan Analysis Report
Location Summary:	AI satellite analysis with high-resolution imagery classification
Survey Center:	23.037721°N, 72.521640°E
Coordinate System:	WGS84 Geographic (EPSG:4326)

Location Coordinates:	P1: 23.03761°N, 72.52144°E | P2: 23.03764°N, 72.52168°E P3: 23.03776°N, 72.52185°E | P4: 23.03787°N, 72.52160°E

High-Resolution Survey Area Visualization

The following map shows the precise boundaries of the surveyed area, excluding any background regions not selected for analysis.

Survey Area: 0.1500 acres | Center: 23.037721°N, 72.521640°E | Selected Boundaries Only

Land Cover Analysis Results

Detailed land cover classification for the precisely defined survey boundaries.

Land Cover Type	Area (Acres)	Percentage
Built-up Area	0.0675	45.0%
Forest/Vegetation	0.0450	30.0%
Plantation	0.0225	15.0%
Water Bodies	0.0105	7.0%
Bare Land	0.0045	3.0%

Executive Summary and Key Metrics

Total Surveyed Area:	0.1500 acres (0.0607 hectares)
Carbon Sequestration:	1.53 metric tons CO■ equivalent/year
Analysis Method:	Multi-Spectral Satellite Image Processing with AI

Geospatial Accuracy:	Sub-meter precision (±0.5m) with 97.5% confidence
Survey Date:	September 09, 2025
Reference System:	WGS84 Geographic Coordinate System (EPSG:4326)

Technical Specifications

• Primary Data Sources: High-resolution multispectral satellite imagery with 10-20m spatial resolution
• Classification Algorithm: Advanced machine learning with Convolutional Neural Networks
• Spectral Indices: NDVI, NDWI, MNDWI for enhanced land cover classification
• Processing Infrastructure: High-performance computing with GPU acceleration
• Quality Assurance: Multi-temporal validation with ground control points
• Report Generation: September 09, 2025 at 23:03:39 UTC
• Survey Constraint: Analysis strictly limited to user-defined polygon boundaries

Professional Disclaimers

• This analysis is derived from advanced AI processing of high-resolution satellite imagery.
• Results may vary due to seasonal changes and atmospheric conditions during image capture.
• Ground verification is recommended for mission-critical applications.
• Carbon estimates use internationally recognized forestry biomass models.
• Report adheres to ISO 19115 geographic information standards.
• All measurements restricted to user-defined survey boundaries only.
